What are 3 HTML elements not mentioned any of the video this week? What do they do and how are they used?

1. The <video> element can be used to add a video player to a web page. You can then choose to mute, loop, autoplay, allow control, adjust size , etc. of the player.
2. The <address> element is used for contact information. Good for having all info needed to contact a person or persons in any form.
- 3.The <button> element is used when we need the user to interact with a page or app. Things like submitting a form, resetting an app, or progressing in the app.

What is a highlight of what you have learned this week?

I think the highlight of the week was learning that html is the structure of a web page. Knowing that is helpful in understanding its role in web development.
